(54) Title: IDENTIFICATION DEVICE

(57) Abstract: A method for manufacturing an identification device or like authenticating means, wherein a carrier (1) is placed with a first side against a main carrier (8), which main carrier (8) is at least partly porous at least on the side facing the carrier (1), wherein on the carrier (1) and/or on the main carrier (8) an image is applied, which image is enclosed at least between the carrier (1) and the main carrier, wherein the carrier (1) and/or the main carrier (8) are subjected to pressure and heated such that the image is at least partly forced into at least the at least partly porous upper side of the main carrier facing the carrier (1), while the carrier (1) preferably fuses at least partly with at least the upper layer of the main carrier (8), thereby reducing the porosity of the upper layer.
